AP Computer Science Principles Pacing Calendar

First/Last Day of Semester
Progress Reports
Holidays/Non-Instructional

Intro to Programming	14 days
Control Structures	15 days
Functions and Parameters	13 days
The Internet, Digital Information	14 Days
Arrays & Data Structures	10 Days
Create Task	8 days
Cumulative Review	10 days
AP Exam	

22

Unit 1 Intro to Programming

Pacing: August 24th - September 11

CodeHS Unit 1: Introduction to Programming with Karel the Dog (3 weeks, 15 hours)

		<u> </u>	
Abstraction	AAP-3.B.1	AAP-3.B.7	Procedural Abstraction
	AAP-3.B.2	CRD-2.G.1	Modularity
CodeHS Activities	AAP-3.B.3	DAT-1.A.2	Program Reuse
Abstraction	AAP-3.B.4	DAT-1.A.5	Digital Data (Bits)
	AAP-3.B.6		Reducing Complexity
Programming Style	CRD-2.G.1	CRD-2.B.5	
	CRD-2.G.2	AAP-3.D.1	Program Documentation
CodeHS Activities	AAP-2.M.1	AAP-3.D.2	Using Existing Code and Libraries
Intro to Programming	AAP-2.M.3	AAP-3.D.3	APIs
Super Karel	CRD-2.B.1	AAP-3.D.4	Commenting Code
Ultra Karel	CRD-2.B.2	AAP-3.D.5	
Top-Down Design			
Commenting Your Code			
Control Structures			
CodeHS Activities	AAP-2.G.1		If/Else Statements (Selection)
If/Else Statements	AAP-2.J.1		For Loops and While Loops
For Loops	AAP-2.K.1		(Iteration)
While Loops in Karel			
Debugging Strategies	CRD-2.I.1		Logic Errors
CodeHS Activities	CRD-2.I.2		Syntax Errors
Functions in Karel	CRD-2.I.3		Run-Time Error
Debugging Strategies	CRD-2.I.5		Testing
Designing Algorithms	AAP-2.A.4		
	AAP-2.M.2		Sequencing, Selection, Iteration
	AAP-2.B.1	AAP-4.A.2	Clarity and Readability
CodeHS Activities	AAP-2.B.2	AAP-4.A.4	Using Existing Algorithms
Karel Algorithms	AAP-2.B.6	AAP-4.A.5	Optimization and Efficiency
	AAP-2.B.7	AAP-4.A.6	
-			

CodeHS Unit 2: Practice PT: Pair-Programming Paint (3 days, 3 hours)

Callabaration and			
Collaboration and	<u>CRD-1.A.3</u>	CRD-2.F.7	Collaboration
Communication	CRD-1.A.4	CRD-2.G.1	Diverse Perspectives

Unit 1 Intro to Programming

Pacing: August 24th - September 11

Subsection	Essentia	al Knowledge	Lessons / Topics
	CRD-1.B.2	CRD-2.G.3	Bias Avoidance
	CRD-1.C.1	CRD-2.G.4	Pair-Programming
	CRD-2.F.5	CRD-2.H.1	Design and Planning
	CRD-2.G.5	CRD-2.H.2	Program Documentation
	CRD-2.F.6		Acknowledgement of Reused Code

CodeHS Unit 3: Programming with JavaScript (2 weeks, 10 hours)

Codens onit 3. Programi	iiiig witii	 	Tooks, to hours,
Programming	AAP-2.A.2		What is Programming?
Languages	AAP-2.A.3		Pseudocode
CodeHS Activities	CRD-1.A.1		Programming Languages
What is Code?	CRD-1.A.2		Computing Innovations
Uses of Programs	CRD-2.B.1		
Variables	AAP-1.A.1	AAP-1.B.2	Variable Names
CodeHS Activities	AAP-1.A.2	AAP-1.B.3	Assignment Operators
Variables	AAP-1.A.3	DAT-1.A.1	Data Types
	AAP-1.A.4		Variables as Abstractions
	AAP-1.B.1		
Arithmetic Expressions	CRD-2.B.4		
CodeHS Activities	AAP-2.B.3		
Basic Math in JavaScript	CRD-2.I.5	AAP-2.B.4	
-	CRD-2.J.1	AAP-2.B.5	Program Behavior
	CRD-2.J.2	AAP-2.C.1	Testing using Inputs
	CRD-2.J.3	AAP-2.C.2	Arithmetic Expressions
	AAP-2.A.1		Order of Operations
	AAP-2.C.3		Modulus
	AAP-2.A.2		String Concatenation
	AAP-2.C.4		
	AAP-2.A.3	AAP-2.D.1	
	AAP-2.A.4		
	AAP-2.D.2		
User Input	AAP-1.C.4	CRD-2.C.5	Strings
CodeHS Activities	AAP-3.A.6	CRD-2.C.6	User Input
User Input	AAP-3.A.9	CRD-2.D.2	Program Output
Mouse Events: Mouse Clicked	CRD-2.C.2		Events
Key Events	CRD-2.C.3		Mouse and Key Events

Unit 2 Algorithm

Pacing: September 14-October 2

	Subsection	Essential Knowledge	Lessons / Topics
--	------------	---------------------	------------------

CodeHS Unit 4: JavaScript Control Structures (2 weeks, 10 hours)

Comparison Operators CodeHS Activities Booleans Comparison Operators	AAP-2.E.1 AAP-2.F.5 AAP-2.F.4 AAP-2.E.2 AAP-2.F.1 AAP-2.F.2 AAP-2.F.3	Booleans Relational Operators Operands
Selection CodeHS Activities If Statements Random Numbers	AAP-2.G.1 AAP-2.I.2 AAP-2.H.1 AAP-2.L.3 AAP-2.H.2 AAP-2.L.4 AAP-2.H.3 AAP-3.E.2 AAP-2.I.1	Selection Conditional Statements Nested Conditionals Equivalent Boolean Statements Random Numbers
Iteration CodeHS Activities While Loops	AAP-2.K.2 AAP-2.L.1 AAP-2.K.3 AAP-2.L.2 AAP-2.K.4 AAP-2.L.5 AAP-2.K.5	Iteration Loops Different but Equivalent Algorithms

Unit 3 Abstraction

Pacing: October 5 - October 23

Subsection Essential Knowledge Lessons / Topics	Subsection	Essential Knowledge	Lessons / Topics

	AAP-3.F.8	

Big Idea 1	: Creative Development (CRD)	Bia Idea 2	: Data (DAT)
CRD-1.A.1	A computing innovation includes a program as an integral part of its function.	DAT-1.A.1	Data values can be stored in variables, lists of items, or standalone constants and can be passed as input to (or output
CRD-1.4.2	A computing innovation can be physical (e.g., self-driving car),		from) procedures.
	nonphysical computing software (e.g., picture editing software),		
CRD-1.A.3	or a nonphysical computing concept (e.g., e-commerce). Effective collaboration produces a computing innovation that reflects the diversity of talents and perspectives of those who	DAT-1.A.2	Computing devices represent data digitally, meaning that the lowest-level components of any value are bits.
CRD-1.A.4	designed it. Collaboration that includes diverse perspectives helps avoid	DAT-1.A.3	Bit is shorthand for binary digit and is either 0 or 1.
CRD-1.A.4	bias in the development of computing innovations.	DAT-1.A.4	A byte is 8 bits.
CRD-1.A.5	Consultation and communication with users are important aspects of the development of computing innovations.	DAT-1.A.5	Abstraction is the process of reducing complexity by focusing
CRD-1.A.6	aspects of the development of computing emolyations. Information gathered from potential users can be used to understand the purpose of a program from diverse perspectives and to develop a program that fully incorporates these perspectives.	DAI-1.A.5	Abstraction is the process of reducing complexity by tocusing on the main idea. By hiding details irrelevant to the question at hand and bringing together related and useful details, abstraction reduces complexity and allows one to focus on the idea.
CRD-1.B.1	Online tools support collaboration by allowing programmers to		
CRD-1.B.2	share and provide feedback on ideas and documents. Common models such as pair programming exist to facilitate	DAT-1.A.6	Bits are grouped to represent abstractions. These abstractions include, but are not limited to, numbers, characters, and color.
	collaboration.		
CRD-1.C.1	Effective collaborative teams practice interpersonal skills, including but not limited to:	DAT-1.A.7	The same sequence of bits may represent different types of data in different contexts.
	§§ communication §§ consensus building	DAT-1.A.8	Analog data have values that change smoothly, rather than in
CRD-2.A.1	§§ conflict resolution §§ negotiation The purpose of computing innovations is to solve problems or		discrete intervals, over time. Some examples of analog data include pitch and volume of music, colors of a painting, or position of a sprinter during a race.
CRD-2.A.2	to pursue interests through creative expression. An understanding of the purpose of a computing innovation	DAT-1.A.9	The use of digital data to approximate real-world analog data is
CRD-2.A.2	An understanding of the purpose of a computing innovation provides developers with an improved ability to develop that	DA1-1.A.9	The use of digital data to approximate real-world analog data is an example of abstraction.
	computing innovation.		
CRD-2.B.1	A program is a collection of program statements that performs	DAT-1.A.10	Analog data can be closely approximated digitally using a
	a specific task when run by a computer. A program is often		sampling technique, which means measuring values of the
	referred to as software.		analog signal at regular intervals called samples. The samples
CRD-2.B.2	A code segment is a collection of program statements that is part of a program.		are measured to figure out the exact bits required to store each sample.
CRD-2.B.3 CRD-2.B.4	A program needs to work for a variety of inputs and situations. The behavior of a program is how a program functions during	DAT-1 R 1	In many programming languages, integers are represented by
CRD-2.B.5	execution and is often described by how a user interacts with it. A program can be described broadly by what it does, or in more detail by both what the program does and how the program		a fixed number of bits, which limits the range of integer values and mathematical operations on those values. This limitation can result in overflow or other errors.
	statements accomplish this function.		
CRD-2.C.1	Program inputs are data sent to a computer for processing by a program. Input can come in a variety of forms, such as tactile, audio, visual, or text.	DAT-1.B.2	Other programming languages provide an abstraction through which the size of representable integers is limited only by the size of the computer's memory; this is the case for the language
CRD-2.C.2	An event is associated with an action and supplies input data to a program.		defined in the exam reference sheet.
CRD-2.C.3	Events can be generated when a key is pressed, a mouse is	DAT-1.B.3	In programming languages, the fixed number of bits used to
	clicked, a program is started, or any other defined action occurs		represent real numbers limits the range and mathematical
	that affects the flow of execution.		operations on these values; this limitation can result in roundoff
CRD-2.C.4	Inputs usually affect the output produced by a program.		and other errors. Some real numbers are represented as
CRD-2.C.5	In event-driven programming, program statements are executed when triggered rather than through the sequential		approximations in computer storage.
CRD-2.C.6	flow of control. Input can come from a user or other programs.	DAT-1.C.1	Number bases, including binary and decimal, are used to represent data.
CRD-2.D.1	Program outputs are any data sent from a program to a device. Program output can come in a variety of forms, such as tactile, audio, visual, or text.	DAT-1.C.2	Binary (base 2) uses only combinations of the digits zero and one.
CRD-2.D.2	Program output is usually based on a program's input or prior state (e.g., internal values).	DAT-1.C.3	Decimal (base 10) uses only combinations of the digits $0 - 9$.
CRD-2.E.1	A development process can be ordered and intentional, or exploratory in nature.	DAT-1.C.4	As with decimal, a digit's position in the binary sequence
CRD-2.E.2	There are multiple development processes. The following phases are commonly used when developing a program: §§ investigating and reflecting		determines its numeric value. The numeric value is equal to the bit's value (0 or 1) multiplied by the place value of its position.
	§§ designing	DAT-1.C.5	The place value of each position is determined by the base
	§§ prototyping §§ testing		raised to the power of the position. Positions are numbered starting at the rightmost position with 0 and increasing by 1 for
CRD-2.E.3	A development process that is iterative requires refinement and revision based on feedback, testing, or reflection throughout the process. This may require revisiting earlier phases of the	DAT-1.D.1	continued on next page each subsequent position to the left. Data compression can reduce the size (number of bits) of
CRD-2.E.4	process. A development process that is incremental is one that breaks		transmitted or stored data.
	the problem into smaller pieces and makes sure each piece	DAT-1.D.2	Fewer bits does not necessarily mean less information.

Big Idea 3: Algorithms and Programming (AAP) A variable is an abstraction inside a program that can hold a value. Each variable has associated data storage that represents one value at a time, but that value can be a list or other collection that in turn contains multiple values. AAP-1.A.2 Using meaningful variable names helps with the readability of program code and understanding of what values are represented by the variables. AAP-1.A.3 Some programming languages provide types to represent data, which are referenced using variables. These types include numbers, Slockens, Ists, and strings. AAP-1.A.4 Some values are better uilled to representation using one type of datum rather than another. AAP-1.B.1 The assignment operator allows a program to change the value represented by a variable. The exam reference sheet provides the " <- " operator to use for assignment. to the variable a. AAP-1.B.3 The value stored in a variable will be the most recent value assigned. For example: ba a 2 display(b) still displays 1.

CRD-2.G.3	the program to be read by people and do not affect how a program runs. Programmers should document a program throughout its development.	DAT-2.A.3	Digitally processed data may show correlation between variables. A correlation found in data does not necessarily indicate that a causal relationship exists. Additional research is needed to understand the exact nature of the relationship.
CRD-2.G.4	Program documentation helps in developing and maintaining correct programs when working individually or in collaborative programming environments.	DAT-2.A.4	Often, a single source does not contain the data needed to draw a conclusion. It may be necessary to combine data from a
CRD-2.G.5	Not all programming environments support comments, so other methods of documentation may be required.		continued on next page variety of sources to formulate a conclusion.
CRD-2.H.1	It is important to acknowledge any code segments that were developed collaboratively or by another source.	DAT-2.B.1	Metadata are data about data. For example, the piece of data may be an image, while the metadata may include the date of
CRD-2.H.2	Acknowledgement of a code segment(s) written by someone else and used in a program can be in the program documentation. The acknowledgement should include the origin or original author's name.	DAT-2.B.2	creation or the file size of the image. Changes and deletions made to metadata do not change the primary data.
CRD-2.I.1	A logic error is a mistake in the algorithm or program that causes it to behave incorrectly or unexpectedly.	DAT-2.B.3	Metadata are used for finding, organizing, and managing
CRD-2.I.2	A syntax error is a mistake in the program where the rules of the programming language are not followed.		information.
CRD-2.I.3	A run-time error is a mistake in the program that occurs during	DAT-2.B.4	Metadata can increase the effective use of data or data sets by
	the execution of a program. Programming languages define		providing additional information.
CRD-21.4	their own run-time errors. An overflow error is an error that occurs when a computer attempts to handle a number that is outside of the defined	DAT-2.B.5	Metadata allow data to be structured and organized.
CRD-2.1.5	range of values. The following are effective ways to find and correct errors: §§ test cases	DAT-2.C.1	The ability to process data depends on the capabilities of the users and their tools.
	Shand tracing \$\$ visualizations \$\$ debuggers \$\$ debuggers \$\$ dadding extra output statement	DAT-2.C.2	Data sets pose challenges regardless of size, such as: §§ the need to dean data §§ incomplete data §§ invalid data
CRD-2.J.1	In the development process, testing uses defined inputs to ensure that an algorithm or program is producing the expected outcomes. Programmers use the results from testing to revise	DAT-2.C.3	§§ the need to combine data sources Depending on how data were collected, they may not be
CRD-2.J.2	their algorithms or programs. Defined inputs used to test a program should demonstrate the different expected outcomes that are at or just beyond the		uniform. For example, if users enter data into an open field, the way they choose to abbreviate, spell, or capitalize something may vary from user to user.
CRD-2.J.3	extremes (minimum and maximum) of input data. Program requirements are needed to identify appropriate defined inputs for testing.	DAT-2.C.4	Cleaning data is a process that makes the data uniform without changing their meaning (e.g., replacing all equivalent abbreviations, spellings, and capitalizations with the same word).

DAT2.C.5 Problems of bias are often created by the type or source of data being collected. Bias is not eliminated by simply collecting more data.

DAT2.C.6 The size of a data set affects the amount of information that can be extracted from it.

DAT-2.C.7 Large data sets are difficult to process using a single computer and may require parallel systems.

DAT-2.C.8 Scalability of systems is an important consideration when working with data sets, as the computational capacity of a system affects how data sets can be processed and stored.
